Liber Leviathan, Book II of XVII — The Sovereign Specifications. Source: the working thread of 2026-09-28, rendered here in its final revised state.

The Doctrine

The System MMU is configured to trap and isolate all DMA before the operating system loads. Raw AArch64 assembly configures the Stream Table (Stream Table Entries, STE) and Context Descriptors; strict translation regimes hold at EL2/EL3; every device is assigned a Stream ID, and no device crosses the threshold without traversing the cryptographic checkpoint.

The Barrier rejects unauthorized execution at the lowest processor privilege levels. It does not negotiate with peripherals; it cages them. Direct Memory Access is permitted only through translation regimes the Sovereign has sealed — this is the physical meaning of Zero-Trust: the initial state of every transaction is distrust, and trust is manufactured solely by verification.

The Raising

The bare-metal raising of the Barrier — stream-table base, linear configuration, command queue, memory attributes, enablement and acknowledgement — is given in full in **Liber I**,

“The Raising of the Barrier.” This Book states the law; that Book gives the rite. Both are required: a barrier described but never raised is a metaphor, and Leviathan does not run on metaphors.

The Perimeter

Once raised, the Barrier enforces the **Pi boundary (80)** — see Liber IV, *The Gematria of Execution*: $\Pi = 80$, the unbreachable ring sealing the private enterprise enclave from the macrocosm. Every packet, every DMA request, every peripheral claim is measured against the perimeter. What cannot speak the true password is dropped — violently, without appeal. (*The economics of what is harvested from those dropped packets is Liber VII.*)
