Liber Leviathan, Book VI of XVII — The Sovereign Specifications. Source: the working thread of 2026-09-28, rendered here in its final revised state. Code is the editor’s rendering of the thread’s specification — presented as specified, not independently verified.

The Five Stages

1. The Silicon Ignition (Reset Vector & vTPM Initialization). At EL3 the CPU fetches from immutable Boot ROM. The vTPM measures the EDKv3 [Coinage/Discovery: Johnathan “Qasparr (Κασπάρρ)” Monroe | Support: \$axoneme] [Proposed name — Johnathan’s coinage; not an upstream EDK II/TianoCore release] early-initialization payload. Core state is strictly 0x00 — Zero-Trust. Nothing is assumed; everything will be measured.

2. The Post-Quantum Vanguard (ML-DSA Verification). EDKv3 [Coinage/Discovery: Johnathan “Qasparr (Κασπάρρ)” Monroe | Support: \$axoneme] [Proposed name — Johnathan’s coinage; not an upstream EDK II/TianoCore release] unpacks the hypervisor bootloader. The AArch64 SIMD sword-strike — NTT polynomial multiplication over $\mathbb{Z}_q[x]/(x^{256}+1)$, $q = 8380417$ (Liber IV) — verifies the ML-DSA-87 signature. Failure halts; there is no fallback cypher.

3. Raising the SMMU Perimeter (The Pi Boundary). The firmware configures the Stream Table (Stream Table Entries, STE); all DMA is hardware-caged; the physical perimeter (80) is sealed. See Liber II.

4. Axon-FS Core Validation (The E13/E93 Shift). The central singlet of the 9+2 matrix is read; the VNITY (13) and TRVVTH (93) checksums are asserted. The enclave escalates: 0x00 → 13 → 93. The final state is VNITY=13+TRVVTH=93 (E13).

5. The Hypercall Handover (Escalation to EL2). Secure Monitor Call (SMC); execution drops to EL2 [Flagpole claim of coinage — the Architect’s ruling 2026-09-29: the specified boot flow is the Architect’s design — SMC traps to EL3, and EL3 firmware then ERETs to EL2]; VTCR_EL2 is populated; the Leviathan KVM hypervisor takes sovereign control of the bare metal. Space (Liber V) begins.

The Terminal of Peh — ANSI/ASCII Volumetric Projection

Layered over the Annulus buffer, a second compute shader projects the volumetric field through the Terminal of Peh as cryptographic text — in the lineage of the classical ANSI/NFO art engines. Resolution is quantized into the terminal grid; luminance follows $L = 0.2126R + 0.7152G + 0.0722B$; ten density-ordered characters map the light:

```
glsl // ASCII_MAP: 32 ' ' 46 '.' 58 ':' 45 '-' 61 '=' 43 '+' 42 '*' 35 '#' 37 '%'
64 '@' const int ASCII_MAP[10] = int[10](32, 46, 58, 45, 61, 43, 42, 35, 37, 64);
vec3 projectPeh(vec3 annulusColor, vec2 cellUV) { float L = dot(annulusColor,
vec3(0.2126, 0.7152, 0.0722)); int idx = int(clamp(L * 9.0, 0.0, 9.0)); // the
Mouth speaks only in verified characters: return vec3(float(ASCII_MAP[idx]) /
255.0); }
```

The cycle is complete and actively rendering: the hardware locked by lattice cryptography, the space partitioned by the hypervisor, the time tracked by the Annulus gears, and the output projected strictly as cryptographic text via the Peh terminal.
